Revision History

- 2011.09.22(Ver. 1.00) : First Release (HTY)
- 2011.09.30(Ver. 1.01) : Separate Protocol between Windows and Linux (HTY)
 - Add Escape Command Enable process on Windows(HTY)
- 2011.10.05(Ver. 1.02) : MiFare Ultra Light Card Write and FeliCa Function added,
 - Type A/B ATR Modified (HTY)
- 2011.10.26(Ver. 1.03) : LoadKey Key Type Add (HTY)
- 2011.12.29(Ver. 1.04) : Mifare Ultra Light function for PS/CS Add (HTY)
- 2012.02.24(Ver. 1.10) : Add FeliCa Batch Command(HTY)
 - Add commands for non-ISO cards.
 - Add method to call vendor commands (Chapter 9)
- 2012.03.08(Ver. 1.11) : Change document name from “CCID PROTOCOL ...”. (HTY)
- 2012.03.22(Ver. 1.12) : Correct miss-typing of RF parameter command from 0x10(HTY)
- 2012.04.06(Ver. 1.13) : Save MIFARE key to nonvolatile memory
 - Add more Card(Tag) Types to ATR(HTY)

1. Introduction

This document defines the USB PC/SC (include CCID) protocol for special function between DUALi's readers and a host computer.

DUALi's readers and modules support ISO7816, ISO14443 type A/B, ISO18092, my-d™, Mifare®, DESFire® FeliCa™, ISO15693 and I-CODE cards and high communication speed depending on the chip used in the reader. But there is some limit when we use it as USB CCID reader.

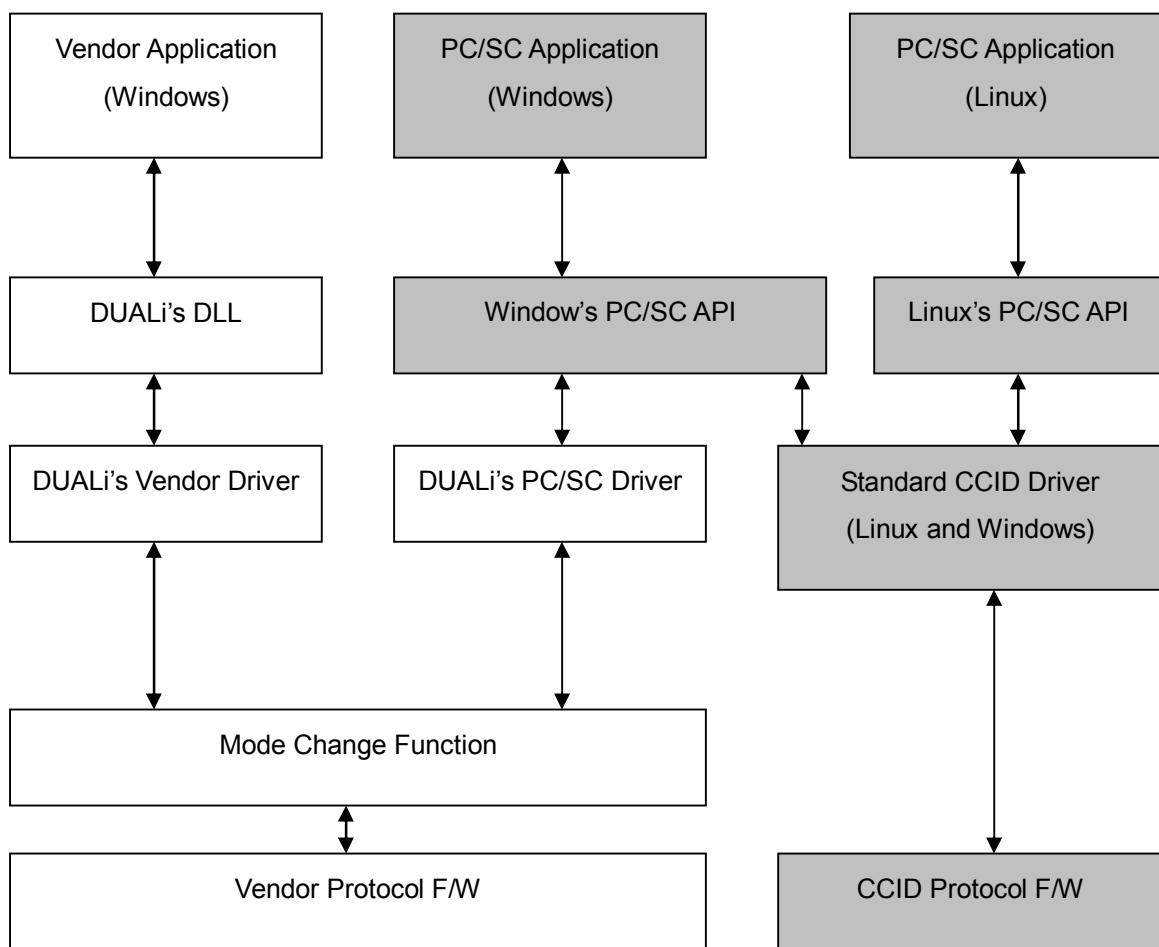

This document is dedicated for all readers and modules. So, when you use some readers of DUALi, those readers have a possibility to return code UNKNOWN COMMAND ERROR(23, 0x17), it means your reader or module doesn't support that command.

my-d™ is registered trademarks of Infineon Technologies AG
FeliCa™ is registered trademark of SONY Corporation
Mifare® and DesFire® are registered trademarks of NXP Semiconductors

2. Communication Interface

2.1 Communication scheme of PC/SC Mode

DUALi's reader supports 3 protocols (proprietary or PC/SC and CCID) depends on firmware. This document explains protocol of PC/SC mode include CCID. In this mode, reader has a compatibility with standard Microsoft API. It supports card detection/removal, auto-selection and ATR generation. Reader can be controlled by pseudo APDU or Control-Code (SCardControl function). You can refer this document if you use **USB PC/SC driver later than “2012-02-02”** version. For more information about this scheme, please contact DUALi Technical Support Team.

3. ATR Generation

If the reader detects a contactless card, an ATR will be generated and sent to the driver for identification of the card. It bypasses ATR for contact card.

3.1 Format for MIFARE, ISO15693 and FeilCa

Byte	Value(HEX)	Designation	Description
0	3B	TS	
1	8n 4 < n < 16	T0	Higher nibble 8 means : only TD1 is following Lower nibble n means : length of historical bytes(Tk)
2	81	TD1	Higher nibble 8 means : only TD2 is following Lower nibble 0 means : T=0 not supported
3	01	TD2	Higher nibble 0 means : no data is following Lower nibble 1 means : T=1 supported
4 ~3+n	0xHH	Tk	Byte for card type <i>0xF0 or 0x01 – Mifare card</i> <i>0xFD or 0x02 – ISO15693 card</i> <i>0xFC or 0x03 – FeliCa card</i> <i>0xF1 – Topaz, NFC Type1 Tag</i>
	UID[4~10]		UID for MiFare Cascade level1 : 4byte Cascade level2 : 7byte Cascade level3 : 10byte UID for FeilCa & ISO15693 : 8byte
4+n	0xHH	TCK	Exclusive-or-ing of all the bytes T0 to TK

Example : ATR for Mifare = {3B 85 81 01 01 D4 82 89 AE 75}

ATR						
TS	T0	TD1	TD2	Card byte	UID	TCK
3B	85	81	01	01(Mifare)	D4 82 89 AE	75

3.2 Format for ISO14443

Byte	Value (HEX)	Designation	Description
0	3B	TS	Fixed value
1	F _n 4 < n < 16	T0	Higher nibble F means : TA1, TB1, TC1, TD1 is following <i>Lower nibble n means : length of historical bytes(Tk)</i>
2	91	TA1	Fixed value
3	00	TB1	Fixed value
4	FF	TC1	Fixed value
5	91		Higher nibble 9 means : TA2, TD2 is following Lower nibble 1 means : T=0 not supported
6	81	TA2	Fixed value
7	71	TD2	Higher nibble 9 means : TA3, TB3, TC3 is following Lower nibble 1 means : T=1 supported
8	FE	TA3	<i>FSCI in case of T=1</i>
9	40	TB3	Higher nibble 4 means : BWI Lower nibble 0 means : CWI
10	00	TC3	Error detection code : using LRC
11 ~ 10+n	0xHH	Tk	<i>Historical byte</i> <i>Tk[0] 'A'(0x41) or 0x0A - type A</i> <i>Historical Data + PUPI[4~]</i> <i>Tk[0] 'B'(0x42) or 0x0B – type B</i> <i>App data[4]+protocol info[3] +80+ PUPI[4]</i>
11+n	0xHH	TCK	Exclusive-OR(XOR) of all the bytes T0 to TK

4. APDU Commands Format

4.1 Except Le

In Windows, depending on driver version, you must not send last Le byte. This is command example of Pseudo-APDU.

Pseudo APDU format (N+5 byte)					
CLASS	INS	P1	P2	LC	DATA IN
0xFD Or 0xFE		0xFE	0xFE	N	Data[0..N-1]

4.2 Include Le

Normally you need to send last Le byte. This is command example of Pseudo-APDU.

Pseudo APDU format (N+6 byte)						
CLASS	INS	P1	P2	LC	DATA IN	Le
0xFD Or 0xFE		0xFE	0xFE	N	Data[0..N-1]	0x00

5. APDU Commands for NON-ISO Cards

5.1 Load keys for MIFARE(nonvolatile memory)

The “Load keys command” will load authentication keys into the reader. The load keys are used to authenticate the particular sector of the MiFare memory card. It saves key at only volatile memory location.

Load keys APDU format (12byte)						
CLASS	INS	P1	P2	LC	DATA IN	Le(option)
0xFD	0x2F	Key type	Locations	0x06	Key[6]	0x00

Key type :

-0x00 : Key is used as type A, -0x04 : Key is used as type B

Locations : 0x00 ~0x0F

-0x00~0x0F : nonvolatile memory

Load keys response format (3byte)		
STATUS CODE	SW1	SW2
Status	0x90	0x00

e.g.

Send: FD2F000006 112233445566 00

Receive: 00 9000

5.2 Read block for MIFARE

The “Read block command” is used for retrieving a data block from the MiFare memory card.

Read block APDU format (7 byte)						
CLASS	INS	P1	P2	LC	DATA IN	Le(option)
0xFD	0x35	Key type	Locations	0x01	Block no	0x00

Key type :

-0x00 : Key is used as type A, -0x04 : Key is used as type B

Locations : 0x00 ~0x0F, 0xFF(for Ultra Light)

Block no : The block to be accessed

Read block response code (19 byte)			
STATUS CODE	DATA OUT	SW1	SW2
Status	Block data[16]	0x90	0x00

Block data : retrieved data from accessed block.

e.g.

Send: FD35000001 01 00 : read block 1 with A-Key, Number 0

Receive: 00 11223344556677889900112233445566 9000

5.3 Write block for MIFARE

The “Write block command” is used for writing a data block into the Mifare memory card.

Write block APDU format (23 byte)							
CLASS	INS	P1	P2	LC	DATA IN	DATA IN	Le(option)
0xFD	0x37	Key type	Locations	0x11	Block no	Block data[16]	0x00

Key type :

-0x00: Key is used as type A, -0x04: Key is used as type B

Locations: 0x00 ~0x0F, 0xFF(for Ultra Light)

Block no: The block to be accessed

Block data: The data to be written into the accessed block.(16byte or 4byte[Ultra Light])

Write block response format (3byte)		
STATUS CODE	SW1	SW2
Status	0x90	0x00

e.g.

Send: FD37000011 01 11223344556677889900112233445566 00

Receive: 00 11223344556677889900112233445566 9000

5.4 Increment and transfer value block for MIFARE

The “Increment and transfer value block command” is used for increment the value block by the specified value in command and transfer this value to the particular block.

Increment and transfer value block APDU format (12 byte)								
CLASS	INS	P1	P2	LC	DATA IN	DATA IN	DATA IN	Le(option)
0xFD	0x33	Key type	Locations	0x06	Inc Block no	Value[4]	Trs Block no	0x00

Key type :

-0x00: Key is used as type A, -0x04: Key is used as type B

Locations: 0x00 ~0x0F

Inc Block no: The block to be increased by the Value[4].

Value: The value used for value manipulation. This variable is an unsigned long integer.

e.g. : if 1, 0x01 0x00 0x00 0x00
if 255, 0xFF 0x00 0x00 0x00

Trs Block no : The block used to transfer the manipulated value.

Increment and transfer value block response format (3byte)		
STATUS CODE	SW1	SW2
Status	0x90	0x00

5.5 Decrement and transfer value block for MIFARE

The “Decrement and transfer value block command” is used for decrement the value block by the specified value in command and transfer this value to the particular block.

Decrement and transfer value block APDU format (12 byte)								
CLASS	INS	P1	P2	LC	DATA IN	DATA IN	DATA IN	Le(option)
0xFD	0x34	Key type	Locations	0x06	Dec Block no	Value[4]	Trs Block no	0x00

Key type:

-0x00: Key is used as type A, -0x04: Key is used as type B

Locations : 0x00 ~0x0F

Dec Block no: The block to be Decreased by the Value[4].

Value: The value used for value manipulation. This variable is a unsigned long integer.

e.g. : if 1, 0x01 0x00 0x00 0x00
if 255, 0xFF 0x00 0x00 0x00

Trs Block no: The block used to transfer the manipulated value.

Decrement and transfer value block response format (3byte)		
STATUS CODE	SW1	SW2
Status	0x90	0x00

5.6 NON-ISO COMMAND(MIFARE DESFIRE and PLUS)

You can use this command when you want to control DESFIRE (EV1) or MIFARE PLUS card in non-ISO mode. Reader controls PCB and CID automatically.

Reader stops checking card existence when this command was executed. So, user must send ‘card checking enable command(0x81)’ after all transaction.

Non-ISO Command APDU format (n+7 byte)						
CLASS	INS	P1	P2	LC	DATA IN	Le(option)
0xFE	0x63	0xFE	0xFE	N+1	Data[0..n]	0x00

Non-ISO Command response format (n+4byte)			
STATUS CODE	DATA OUT	SW1	SW2
Status	Data[0..n]	0x90	0x00

e.g. (DESFIRE)

Send: FE63FEFE01 60 00 : Get Version1
Receive: 00 AF04010101001605 9000

Send: FE63FEFE01 AF 00 : Get Version2
Receive:.....

Send: FE63FEFE01 AF 00 : Get Version3
Receive:

Send: FE63FEFE04 5A010000 00 : Select Application
Receive: 00 00 9000

Send: FE81FEFE01 00 00 : Start Card Check again
Receive: 00 9000

e.g. (PLUS)

5.7 Type-A Transparent COMMAND

You can use this command when you want to send any commands to all type-A cards. All data include PCB, CID and Rx-Timeout must be controlled by user. Refer to ‘8.5 FeliCa Transparent’ for more data of Timeout.

User must disable card existence checking first. And, user must send ‘card checking enable command(0x81)’ after all transaction.

Type-A Transparent APDU format (n+7 byte)						
CLASS	INS	P1	P2	LC	DATA IN	Le(option)
0xFE	0x41	0xFE	0xFE	N+1	Data[0..n]	0x00

Data: include PCB, CID, CMD, DATA and Rx Timeout,

Type-A Transparent response format (n+4byte)			
STATUS CODE	DATA OUT	SW1	SW2
Status	Data[0..n]	0x90	0x00

e.g. (MIFARE PLUS)

Send: FE81FEFE01 FF 00 : **Disable card existence checking**
Receive:00 9000

Send: FE11FEFE00 00 : RF OFF, Refer to “9.Vendor Command”.
Receive:00 9000

Send: FE10FEFE00 00 : RF ON, Refer to “9.Vendor Command”.
Receive:00 9000

Send: FE21FEFE00 00 : REQA, Refer to “9.Vendor Command”.
Receive:00 4403 9000

Send: FE3DFEFE00 00 : ANTICOLLISION-SELECT, Refer to “9.Vendor Command”.
Receive:00 20 04472AA1431C80 9000

Send: FE41FEFE03 E080 10 00 : RATS, Timeout=16(0x10)millisecond.

Receive:00 20 04472AA1431C80 9000

Send: FE41FEFE04 0A0060 10 00 : Get Version1 PCB=0x0A, CID=0x00, CMD=0xA8,
Rx Timeout=0x10.

Receive: 00 0A00AF04010101001605 9000

:

Send: FE81FEFE01 00 00 : **Start Card Check again**

Receive:00 9000

5.8 Type-B Transparent COMMAND

You can use this command when you want to send any commands to all type-B cards. All data include PCB, CID and Rx-Timeout must be controlled by user. Refer to ‘8.5 Felica Transparent’ for more data of Timeout.

User must disable card existence checking first. And, user must send ‘card checking enable command(0x81)’ after all transaction.

Type-B Transparent APDU format (n+7 byte)						
CLASS	INS	P1	P2	LC	DATA IN	Le(option)
0xFE	0x60	0xFE	0xFE	N+1	Data[0..n]	0x00

Data: include PCB, CID, CMD, DATA and Timeout.

Type-B Transparent response format (n+4byte)			
STATUS CODE	DATA OUT	SW1	SW2
Status	Data[0..n]	0x90	0x00

e.g.

Send: FE81FEFE01 FF 00 : **Disable card existence checking**
Receive:00 9000

Send: FE11FEFE00 00 : RF OFF, Refer to “9.Vendor Command”.
Receive:00 9000

Send: FE10FEFE00 00 : RF ON, Refer to “9.Vendor Command”.
Receive:00 9000

Send: FE60FEFE04 05000005 00 : Write Perso REQB command, Rx Timeout=0x05
Receive: 00 507505717500014B40008181 9000

:

Send: FE81FEFE01 00 00 : **Start Card Check again**
Receive:00 9000

6. APDU Commands For Reader Control

Le(=0x00) can be followed behind DATA when send pseudo APDU.

6.1 Get Reader Version

The “Get reader version command” is used for retrieving the version of reader.

Get reader version APDU format (6 byte)					
CLASS	INS	P1	P2	LC	Le(option)
0xFE	0x16	0xFE	0xFE	0x00	0x00

Get reader version response code (n+3 byte)			
STATUS CODE	DATA OUT	SW1	SW2
Status	Version data[n]	0x90	0x00

Version data: retrieved version data from reader.

e.g.

Send: FE16FEFE00 00

Receive: 00 44452D3632305F3131303931375F43434944 9000

→ ASCII : DE-620_APP_110917_CCID

6.2 Control auto-polling

The “Control auto-polling command” is used to stop/start auto-polling function in the reader.

When auto-polling is stopped, reader can't support card detection/removal function.

Control auto-polling APDU format (7 byte)						
CLASS	INS	P1	P2	LC	DATA IN	Le(option)
0xFE	0x81	0xFE	0xFE	0x01	Data[0]	0x00

Auto-polling stop: Data[0] =0xFF

Auto-polling start: Data[0] =0x00

Control auto-polling response code (3 byte)		
STATUS CODE	SW1	SW2
Status	0x90	0x00

e.g.

Send: FE81FEFE01 FF 00: auto polling stop

Receive: 00 9000

6.3 Control RF and Contact

This “Control RF and Contact command” is used to enable/disable RF and CONTACT slot in the reader.

Control RF and Contact APDU format (7 byte)						
CLASS	INS	P1	P2	LC	DATA IN	Le(option)
0xFE	0x82	0xFE	0xFE	0x01	Data[0]	0x00

Stop checking RF and Disable Contact slot: Data[0] =0x80 (useful when control FeliCa or ISO-15693 card)

☞ Reader disconnects previous connection with card if it receives below data. It needs to reconnect to card after sending 0x01, 0x02 and 0x03.

Enable RF and Disable Contact slot: Data[0] =0x01

Disable RF and Enable Contact Slot: Data[0] =0x02

Enable both RF and Contact slot: Data[0] =0x03

Control RF and Contact response code (3 byte)		
STATUS CODE	SW1	SW2
Status	0x90	0x00

e.g.

Send: FE82FEFE01 01 00: Enable RF and Disable Contact

Receive: 00 9000

6.4 Get card status

The “Get card status command” is used for retrieving the interface information between reader and card.

Get card status APDU format (6 byte)					
CLASS	INS	P1	P2	LC	Le(option)
0xFE	0x17	0xFE	0xFE	0x00	0x00

Get card status response code (22 byte)			
STATUS CODE	DATA OUT	SW1	SW2
Status	Status data[19]	0x90	0x00

. Status data : retrieved interface information between reader and card	
Data[0]	Auto-polling (0x01:disable, 0x00:enable)
Data[1]	RF status (0x01:rf on, 0x00:rf off)
Data[2]	Card type (0x41: type A, 0x42: type B, 0x4d: ISO14443 Part3(MiFare), 0x43: FeilCa, 0x49: ISO15693, 0xff: No card)
Data[3]	Reader's Max Bit rates(Tx/Rx max) (0:106 1:212 2:424 3:847) Kbit/s In case of 847 for Tx/Rx, reader returns: 0x03.
Data[4]	Card Bit rates(Tx max) (0:106 1:212 2:424 3:847) Kbit/s
Data[5]	Card Bit rates(Tx current) (0:106 1:212 2:424 3:847) Kbit/s
Data[6]	Card Bit rates(Rx max) (0:106 1:212 2:424 3:847) Kbit/s
Data[7]	Card Bit rates(Rx current) (0:106 1:212 2:424 3:847) Kbit/s
Data[8]	Cascade level (Type A:0x01,0x02,0x03 Type B, FeliCa, ISO15693:0xff)
Data[9~18]	UID (default buffer value:0xff) Ex1] cascade level 1 => Data[9~12] : UID, last bytes(Data[13~18]) will be 0xff. Ex2] cascade level 2 => Data[9~15] : UID, last bytes(Data[16~18]) will be 0xff. Ex3] cascade level 3 => Data[9~18] : UID. Ex4] type B => Data[9~12] : UID, last bytes(Data[13~18]) will be 0xff. Ex5] FeliCa => Data[9~16] : UID, last bytes(Data[17~18]) will be 0xff. Ex6] ISO15693 => Data[9~16] : UID, last bytes(Data[17~18]) will be 0xff.

6.5 Control buzzer

The “Control buzzer command” is used to stop/start buzzer beep in the reader.

Control buzzer APDU format (7 byte)						
CLASS	INS	P1	P2	LC	DATA IN	Le(option)
0xFE	0x13	0xFE	0xFE	0x01	Data[0]	0x00

Buzzer beep start: Data[0] =0x00

Buzzer beep stop: Data[0] =0x01

Control buzzer response code (3 byte)		
STATUS CODE	SW1	SW2
Status	0x90	0x00

e.g.

Send: FE13FEFE01 00 00 : Buzzer On

Receive: 00 9000

6.6 RF parameter Control

This command Changes RF related parameters.

Control buzzer APDU format (7 byte)									
CLASS	INS	P1	P2	LC	DATA IN			Le(option)	
0xFE	0x1D	0xFE	0xFE	0x01 Or 0x03	Data[0] RF Type	Data[1] Para Type	Data[2..] Para Value	0x00	

Data[0] : RF Type

Data[0]	Description
0x10	Read all Parameter Data
0x11	Type A parameter set
0x12	Type B parameter set
0x13	FeliCa parameter set
0x14 ~ 0x18	RFU
0x19	Type A 212/424/848K parameter set(gain,threshold)
0x1B	Special parameter
0x1F	Return to default parameter values

Data[1] : Parameter Type

Data[1]	Description
0x00	Maximum speed set (Tx and Rx Common)
0x01	CwConductance, RF field strength set Strictly prohibited to change
0x02	ModConductance, Modulation set Strictly prohibited to change
0x03	Rx signal gain set Strictly prohibited to change
0x04	Rx threshold level set Strictly prohibited to change
0x05	RF Level set Strictly prohibited to change

Data[2] : Parameter Value

Data[1]	Data[2] Description
0x00	Maximum speed set (Tx and Rx Common) 0(106Kbps), 1(212Kbps), 2(424Kbps), 3(848Kbps)
0x01	CwConductance, RF field strength set 0(Minimum RF strength)~63(Maximum RF strength) Strictly prohibited to change
0x02	ModConductance, Modulation set 0(Maximum Modulation) ~ 63(Minimum Modulation) Strictly prohibited to change
0x03	Rx signal gain set 1(lowest gain)~3(highest gain) Strictly prohibited to change
0x04	Rx threshold level set Refer to PN512 datasheet Strictly prohibited to change
0x05	RF Level set Refer to PN512 datasheet Strictly prohibited to change

Special parameter(Data[0] = 0x1B)

Data[1]	Data[2].. Description
0x00	Data[2] ~Data[5] : Serial communication baudrate(RS-232,TTL), Little endian
0x01	Data[2] :Maximum FWI value set, Card Response Wait Time. 1~9 (less than 300msecond) 10(0.31 second) 11(0.62 second) 12(1.24 second) 13(2.47 second) 14(4.9485 second), Common for all RF type If change, recommend to use 11 or 12
0x02	Data[2] :Reader number set
0x03	15693 option(not use)

Response frame when transmitted Data[0] is not 0x10

Control buzzer response code (3 byte)		
STATUS CODE	SW1	SW2
Status	0x90	0x00

Response frame when transmitted Data[0] is 0x10

Control buzzer response code (3 byte)			
STATUS CODE	DATA OUT	SW1	SW2
Status	Data[0..29] Parameters	0x90	0x00

Parameters Format

Data[0...3]	Device Type[Proprietary(0x00) or PCSC]
Data[4...9]	Type-A parameters for 106Kbps, Refer ot Parameter Type Table. (From Data[1] is 0x00 to 0x05)
Data[10...15]	Type-B parameters, refer ot Parameter Value Table
Data[16...21]	FeliCa parameters, refer ot Parameter Value Table
Data[22...27]	RFU
Data[28...33]	RFU
Data[34...39]	RFU
Data[40...45]	RFU
Data[46...51]	RFU
Data[52...57]	Type A 212/424/848K parameters(gain,threshold)
Data[58...63]	RFU
Data[64...67]	Serial communication baudrate(RS-232,TTL), Little endian
Data[68]	Maximum FWI
Data[69]	Reader Address
Data[70]	RFU
Data[71...80]	RFU

e.g.

Send: FE10FEFE03 1B010B 00 : Type-A, Response Wait for 0.62 second.

Receive: 00 9000

6.7 Flash Memory Read/Write

This command reads or writes user data from/to reader flash memory. (Maximum size is 128 byte)

Control buzzer APDU format (7 byte)								
CLASS	INS	P1	P2	LC	DATA IN			Le(option)
0xFE	0x13	0xFE	0xFE	0x01	Data[0] 0x00 Or 0xFF	Data[1] offset	Data[2..]	0x00

Flash Write:

Data[0] : 0xFF

Data[1] : Start Position

Data[2 ...] : Data to Write

Flash Read :

Data[0] : 0x00

Data[1] : Start Position

Data[2] : Length to Read

Control buzzer response code (3 byte)			
STATUS CODE	DATA OUT	SW1	SW2
Status	Data[0..]	0x90	0x00

DATA OUT exists only read flash.

e.g.

Send: FE1FFEFE03 00000A 00 : Read 10 byte from first position.

Receive: 00 FFFFFFFFFFFFFFFF 9000

7. APDU Commands For ICC or SAM Control

Le(=0x00) can be followed behind DATA when send pseudo APDU.

7.1 ICC Power On

Reader resets IC or SAM card from appointed slot and receives ATR.

ICC Power On APDU format (8 byte)							
CLASS	INS	P1	P2	LC	DATA IN		Le(option)
0xFE	0xC0	0xFE	0xFE	0x02	Data[0] Slot	Data[1] 0x00	0x00

Slot

0: First Slot (Contact Card slot, SAM1 slot for DE-ABCM)

1: Second Slot (SAM1 slot, SAM2 slot for DE-ABCM)

2: Second Slot (SAM2 slot)

ICC Power On response code (n+3 byte)			
STATUS CODE	DATA OUT	SW1	SW2
Status	ATR[n]	0x90	0x00

ATR data: retrieved ATR data from Contact card or SAM.

e.g.

Send: FEC0FEFE02 0100 00 : Second Slot, Power On

Receive: 00 3B690000806355528083079000 9000

7.2 ICC Tranceive

Reader sends APDU+data(n) (5+n bytes) to the ICC or SAM slot and receives data and status words.

Card Transive APDU format (n+7 byte)							
CLASS	INS	P1	P2	LC	Data[0]	Data[1..n]	Le(option)
0xFE	0xC9	0xFE	0xFE	n+1	Slot	APDU+DATA	0x00

Slot

0: First Slot (Contact Card slot, SAM1 slot for DE-ABCM)

1: Second Slot (SAM1 slot, SAM2 slot for DE-ABCM)

2: Second Slot (SAM2 slot)

Card Transive response code (3 byte)			
STATUS CODE	Data	SW2	SW2
Status	Response from card(Data+SW)	0x90	0x00

e.g.

Send: FEC9FEFE08 01 00A4000002 1122 00 : Second Slot, Select File(Applet)

Receive: 00 6A82 9000 : SW=0x6A82, File Not Exist

7.3 ICC Power Off

Reader disables contact card in the slot.

Power Off APDU format (7 byte)						
CLASS	INS	P1	P2	LC	Data[0]	Le(option)
0xFE	0x82	0xFE	0xFE	0x01	Slot	0x00

Slot

0: First Slot (Contact Card slot, SAM1 slot for DE-ABCM)

1: Second Slot (SAM1 slot, SAM2 slot for DE-ABCM)

2: Second Slot (SAM2 slot)

Power Off response code (3 byte)		
STATUS CODE	SW1	SW2
Status	0x90	0x00

e.g.

Send: FEC5FEFE01 01 00 : Second Slot, Power Off

Receive: 00 9000

8. APDU Commands For FeliCa Card Control

Le(=0x00) can be followed behind DATA when send pseudo APDU.

8.1 FeliCa SAM Authentication

This is a authentication between the FeliCa USER and RC-S251(SAM) based on a 3-way mutual authentication mechanism using shared symmetrical keys. User must submit this symmetrical a 24-byte key to RC-S251. The default CBC is all 0x00s. The method of the authentication is not disclosed and executed inside the reader.

Reader stops checking card existence when this command was executed. So, user must send card checking enable command(0x81) after all transaction.

FeliCa SAM Authentication format (39 byte)						
CLASS	INS	P1	P2	LC	DATA IN	Le(option)
0xFE	0x56	0xFE	0xFE	33	ENC Mode Default Key[24] CBC[8]	0x00

ENC Mode: this mode is maintained until finish all transactions.

0: authentication for unencrypted communication

1: authentication for encrypted communication

Default Key : symmetrical a 24-byte TDES key

CBC : default CBC is {0x00,0x00,0x00,0x00,0x00,0x00,0x00,0x00}

FeliCa SAM AuthTransparent response code (13 byte)			
STATUS CODE	DATA OUT	SW1	SW2
Status	IDM[8] IDt[2]	0x90	0x00

8.2 FeliCa Mutual Authentication

This is a authentication between the FeliCa card and RC-S251(SAM). User must submit global key and user key. The method of the mutual authentication is not disclosed and executed inside the reader.

FeliCa SAM Authentication format (26 byte)						
CLASS	INS	P1	P2	LC	DATA IN	Le(option)
0xFE	0x57	0xFE	0xFE	20	Area Code[2] Service Code[2] Global Key[8] User Key[8]	0x00

FeliCa SAM AuthTransparent response code (3 byte)		
STATUS CODE	SW1	SW2
Status	0x90	0x00

8.3 FeliCa Mutual Authentication RWSAM

This is a authentication between the FeliCa card and RC-S251(SAM) using the keys stored in SAM. User doesn't need to submit keys but need to submit key codes and versions. The method of the mutual authentication is not disclosed and executed inside the reader.

FeliCa SAM Authentication format (16 byte)						
CLASS	INS	P1	P2	LC	DATA IN	Le(option)
0xFE	0x58	0xFE	0xFE	10	System Code[2] GSK Code and Version[4] USK Code and Version[4]	0x00

FeliCa SAM AuthTransparent response code (3 byte)		
STATUS CODE	SW1	SW2
Status	0x90	0x00

8.4 FeliCa Command

This command is used to exchange commands with the FeliCa card after authentication. IDtr is controlled inside the reader. User must submit all other data. User can read or write each block using this command. The method of the process is not disclosed and executed inside the reader.

FeliCa SAM Authentication format (n+9 byte)						
CLASS	INS	P1	P2	LC	DATA IN	Le(option)
0xFE	0x59	0xFE	0xFE	33	Header[4] Input Data[0..n]	0x00

Header[4]: Dispatcher[0], Reserved[2], Command Code[1]

Input Data: all other data except IDtr

FeliCa SAM AuthTransparent response code (n+4 byte)			
STATUS CODE	DATA OUT	SW1	SW2
Status	Data[0..n]	0x90	0x00

8.5 FeliCa Transparent

Reader receives data from Host and sends data with computed CRC to the FeliCa card and transfer response from FeliCa card. **To control FeliCa Card, auto card removal detection of reader must be disabled by sending ‘Stop Card Checking’ command (0x81).**

FeliCa Transparent APDU format (8 byte)							
CLASS	INS	P1	P2	LC	DATA IN		Le(option)
0xFE	0x50	0xFE	0xFE	N	Data[0..N-2] CMD + Data	Data[N-1] TIMEOUT	0x00

TIMEOUT

TOUT Value in hexadecimal	Time Value	FWI
0x02	1.208 msec	2
0x03	2.416 msec	3
0x05	4.832 msec	4
0xA	9.664 msec	5
0x14	19.32 msec	6
0x27	38.66 msec	7
0x4E	77.3 msec	8
0x9B	154.6 msec	9
0xB0 ~	309.3 msec	10
0xC0 ~	618.6 msec	11
0xD0 ~	1.2371 sec	12
0xE0 ~	2.4742 sec	13
0xF0 ~	4.9485 sec	14
0xFF	9.897 sec	15

FeliCa Transparent response code (n+3 byte)			
STATUS CODE	DATA OUT	SW1	SW2
Status	Data[n]	0x90	0x00

Data[n]: retrieved data from FeliCa card.

8.6 FeliCa Example

FeliCa Read/Write Example

Send: FE56FEFE21

Send: FE81FEFE01 00 00 : Start Checking RF and Contact Card

Receive: 00 9000

9. Vendor Commands

9.1 Command Call Method

There are various vendor commands for card and reader control. All the commands are explained at “RW_Protocol_spec_xxxxx.pdf”. These all commands could be executed in CCID mode. This is the rule to call vendor commands in CCID mode. Some commands are not supported because reader doesn’t support that command. This restriction caused by small program memory size.

Vendor Protocol(Send)

Name	STX	LEN-H	LEN-L	CMD	Data	LRC
Values	0x02	0xHH	0xHH	0xHH	Data[N-1]	0xHH
Length.	1-byte	N		1-byte	n-byte	1-byte

CCID COMMAND(Send)

CLASS	INS	P1	P2	LC	DATA IN	Le(option)
0xFE	0x50	0xFE	0xFE	N-1	Data[N-1]	0x00

Vendor Protocol(Receive)

Name	STX	LEN-H	LEN-L	Resp	Data	LRC
Values	0x02	0xHH	0xHH	0xHH	Data[N-1]	0xHH
Length.	1-byte	N		1-byte	n-byte	1-byte

CCID COMMAND(Receive)

Resp	DATA IN	SW
STATUS	Data[0..n]	0x9000

Refer to “11. STATUS(Response) Code Definition” for STATUS information.

10. CCID Control Code

10.1 Control Code Table

Developer can use pseudo APDU or Control-Code when card was activated. But developer can use Control-Code although card was not activated. Command and Data format for Control Codes are same with pseudo APDU. You can refer previous chapters for pseudo APDU for detail data format. You also can refer “RW_Protocol_spec_xxxxx.pdf” for more control codes. All the vendor commands could be supported as control code. Some commands(control code) could not be supported depend on program memory size of reader/module.

Control Code Detail				
Control Code	Data	Description	Reference Chapter	
0x12		Reboot Reader		
0x13	0x00 0x01	Buzzer ON Buzzer OFF	6.5	
0x16		Reader Version	6.1	
0x17		Get Card Status	6.4	
0x1D		RF Parameter Set	6.6	
0x1F	0xFF 0x00	Flash Wrtie Flash Read	6.7	
0x81	0xFF 0x00	RF Polling Stop RF Polling Start	6.2	
0x82	0x80 0x01 0x02 0x03	Stop RF Checking ☞ Reader disconnects previous connection with card if it receives below data. 0x01 Enable RF, Disable Contact slot 0x02 Enable Contact Slot, Disable RF 0x03 Enable RF and Contact Slot	6.3	Bit7(0x80):RF checking Bit0(0x01):RF Enable Bit1(0x02):Contact Enable It needs to connect to card again after sending 0x01,0x02 and 0x03.
0xC0	Data[0] Data[1]	ICC Power ON Data[0] –Slot No Data[1]- Fix to 0x00	7.1	
0xC9	Data[n]	Send APDU and Data to ICC Data[0..4] : APDU Data[5..(n-1)] : Data	7.2	
0xC5	Slot No.	ICC Power Off	7.3	

e.g. 1

Send: 0x8201: Enable RF, Disable Contact Slot

Receive: 0x00: (Response Code)

e.g. 2

Send: 0x16: Reader Firmware Version Request

Receive: 0x00 44452D3632305F3131303931375F43434944 (Response
Code+Data)

→ ASCII : DE-620_APP_110917_CCID

10.2 Control Code Usage Enable on Linux

You don't need to refer this chapter if you use DUALi's CCID driver.

When you want to use standard CCID driver, you need to change option data for 'Control Code Enable' and add reader data (VID, PID and NAME) to '/etc/libccid.plist'.

```
<key>ifdDriverOptions</key>
  <string>0x0001</string>
...
<key>ifdVendorID</key>
<array>
...
<string>0x1DB2</string>
</array>

<key>ifdProductID</key>
<array>
...
<string>0x0802</string>
</array>

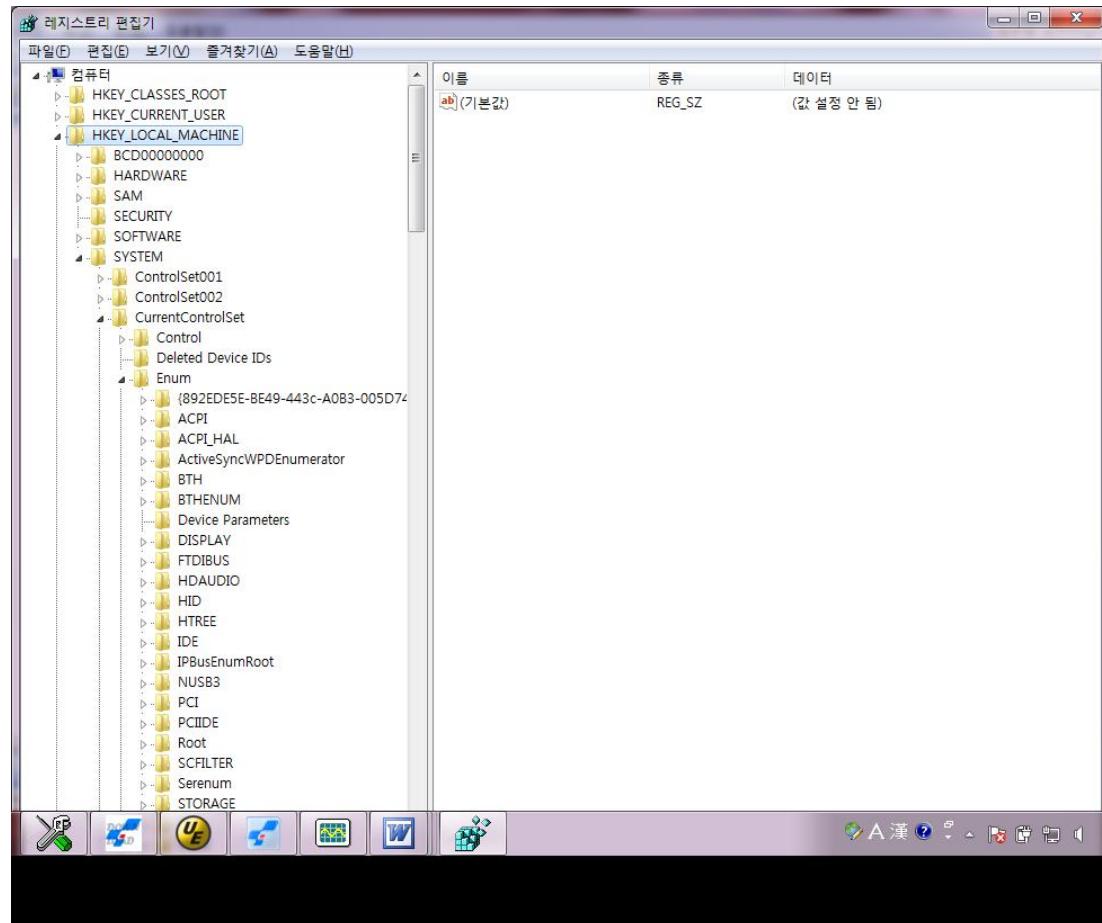

<key>ifdFriendlyName</key>
<array>
...
<string>DUALi DE-ABCM Combi</string>
</array>
```

This is list of DUALi's readers.

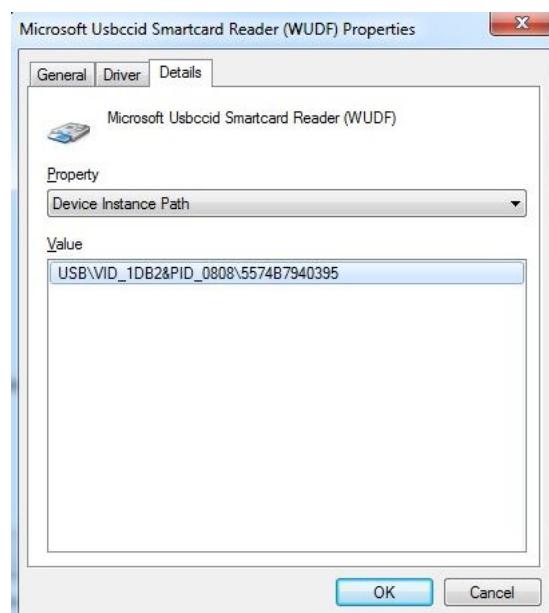

VID	PID	NAME
0x1DB2:0x0801		DUALi DE-620 Combi Reader
0x1DB2:0x0802		DUALi DE-ABCM Combi Reader
0x1DB2:0x0803		DUALi DE-620L Combi Reader
0x1DB2:0x0804		DUALi DE-ABM4 Contactless Reader
0x1DB2:0x0805		DUALi DE-ABM4S Contactless Reader
0x1DB2:0x0806		DUALi DE-ABM5 Contactless Reader
0x1DB2:0x0807		DUALi DE-ABCM2 Contactless Reader
0x1DB2:0x0808		DUALi DE-620R Combi Reader
0x1DB2:0x0809		DUALi DE-EPASS10 Contactless Reader

10.3 Control Code Usage Enable on Windows XP

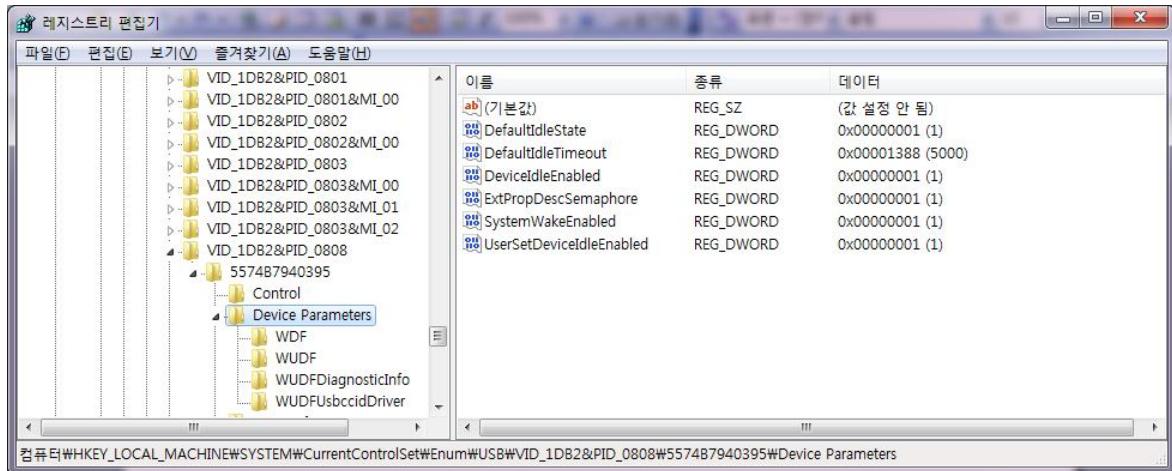

- Execute “regedit”.
 - Go to My Computer > HKEY_LOCAL_MACHINE > SYSTEM > CurrentControlSet > Enum > USB

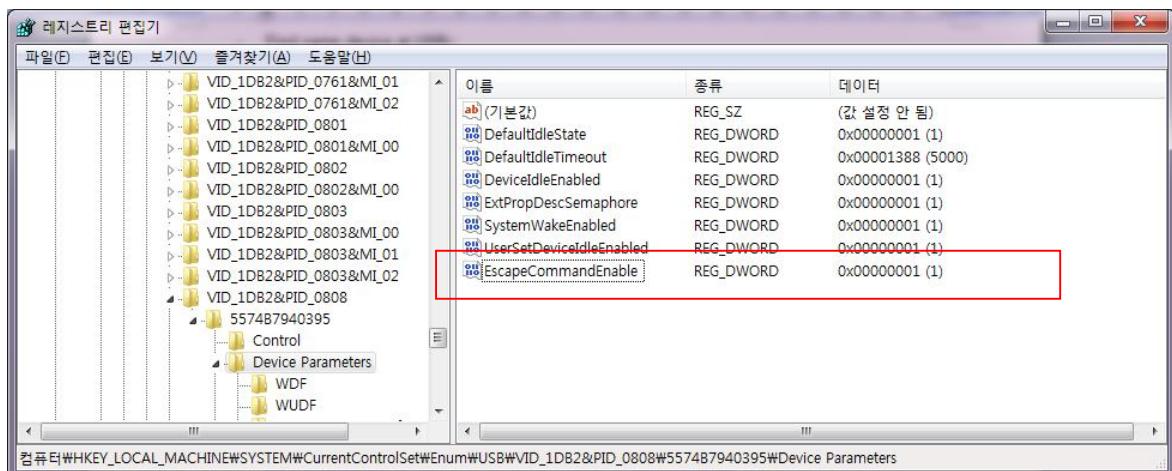

- Check “Device Instance Path” of the reader at Device Manager.

- Find same device at “My Computer > HKEY_LOCAL_MACHINE > SYSTEM > CurrentControlSet > Enum > USB”

- Create new DWORD(32bit) Value parameter named “EscapeCommandEnable” at **Device Parameters**.
- Double click the parameter and change the value to “1”.

- Reboot PC. And then you can use SCardControl Function.
- It's not allowed to access through SCardControl on Windows7 yet.
